

ABSTRACT OF THE INVENTION

An orderly single striking device for a nail gun includes a press plate provided with a projection to contact and push always a valve switch to let pressure
5 air to continue flowing into a cylinder of the nail gun so as to move forward the piston with a striking needle to the front position to complete nail striking action, even if the piston should stop at a middle way of its stroke due to some cause and block wind holes in an annular
10 wall of the cylinder after the trigger is pulled for striking a nail. So the device can prevent a nail from being stricken in vain or intermittently, smoothing striking action and upgrading work efficiency of the nail gun.
